## B 9 Battery Supply Unit

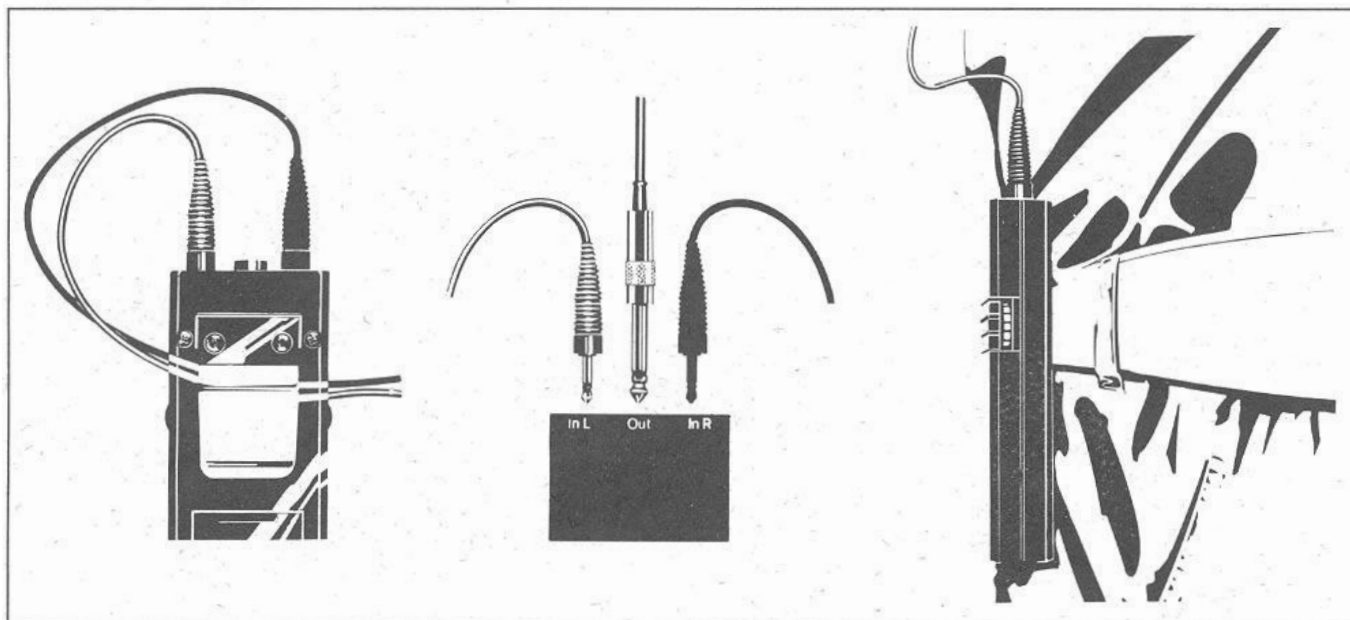

The B 9 battery supply unit provides the AKG MicroMic Series microphones with 9-V phantom power (6F22 9-V battery) and allows them to be operated on mixers, tape recorders, etc. without integrated phantom power.

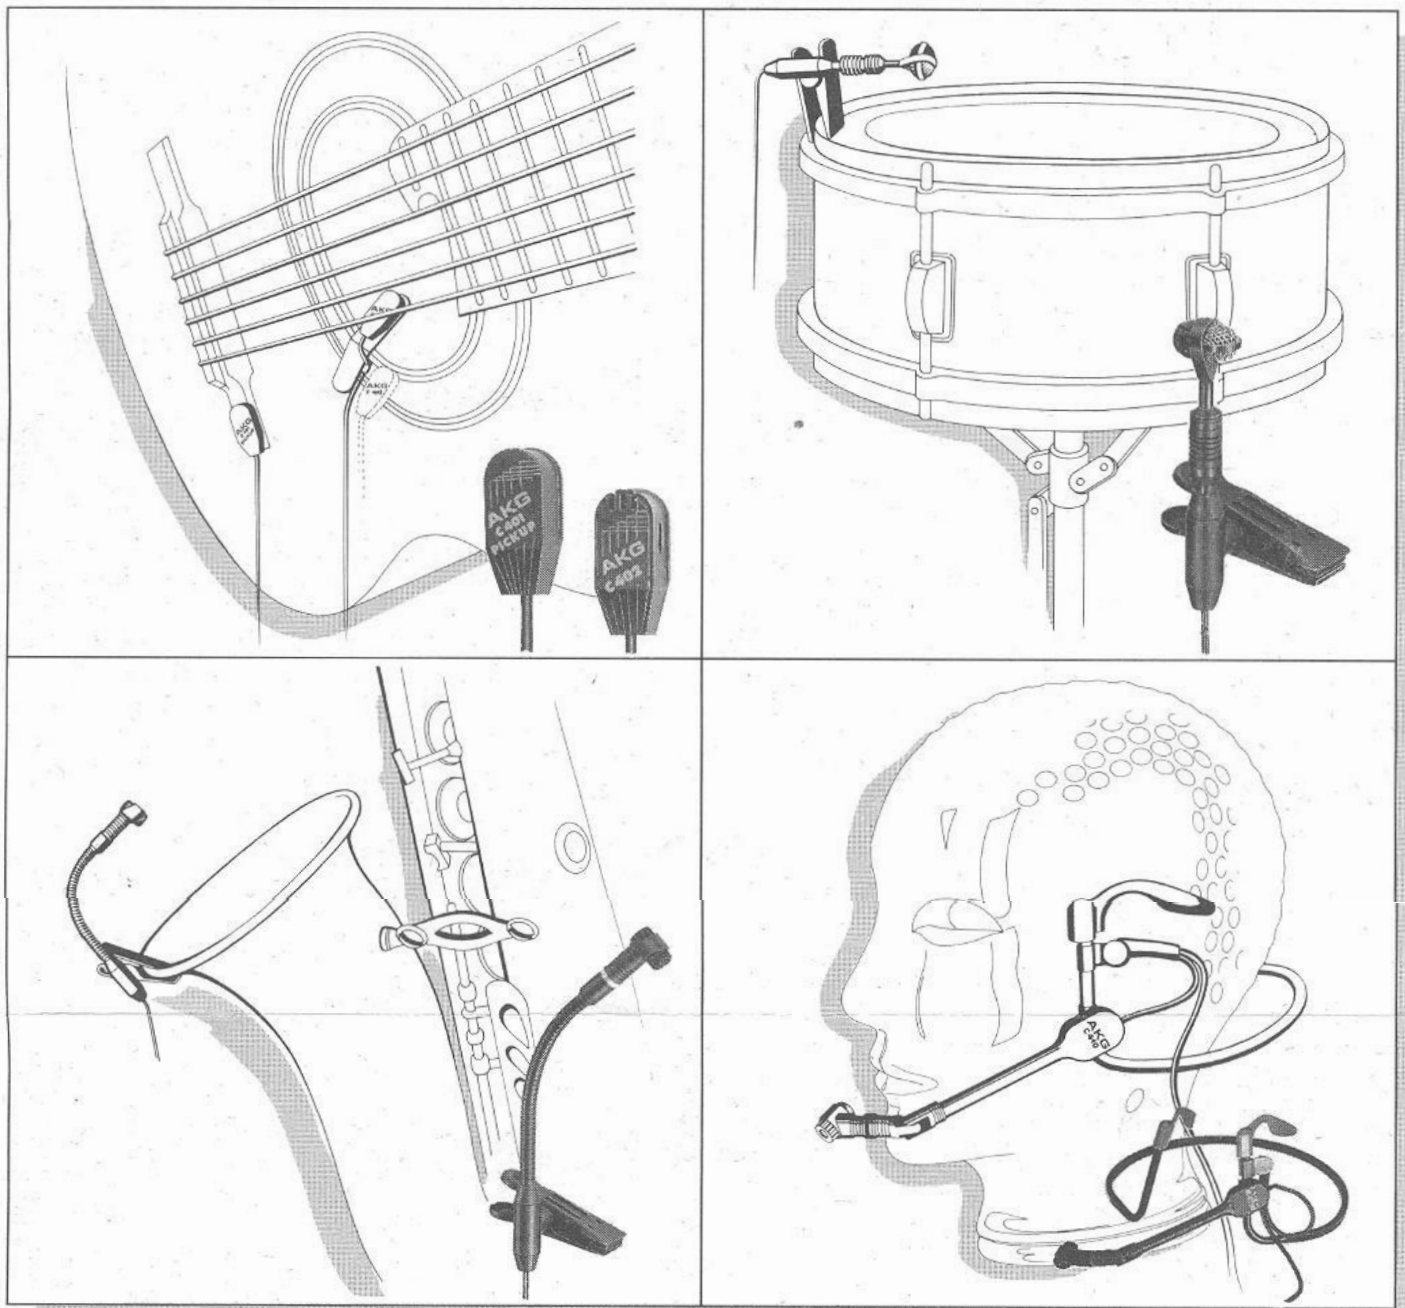

The B 9 has two inputs (3.5-mm jack sockets) to power two microphones. The B 9 can thus be used with any two AKG MicroMic Series microphones (C 401 Pickup, C 402, C 408, C 409). The balance control adjusts the balance between the two microphones, compensating for level differences, e.g., between

a voice and an instrument. There is also a master volume control and the output is a 1/4" mono jack socket that switches the B 9 on when a plug is inserted and off on disconnecting the plug. Since the battery will last longer with the B 9 switched off when not in use, be sure to disconnect the output cable after each gig, recording session, or rehearsal.

On the rear of the B 9 there is the battery compartment and a metal clip for fixing the unit to your belt, guitar strap, or the like.

# MicroMic

The B9 has been designed specifically for the MicroMic Series microphones. Their transducers are all wired with negative connected to ground to ensure phase compatibility among the MicroMics. In addition, the B9 boosts the frequency range below 1 kHz by 2 to 4 dB to equalize the MicroMics' frequency responses. If you wish to power any other microphone remember that its frequency response will be altered accordingly by the B9. A microphone drawing too much current (above approx. 400  $\mu$ A) may cause the supply voltage to break down so the mic will not function.
